Department of Computer Science
DATA ANALYTICS USING PYTHON RECORD

Program No: 1	Date: 09/07/2025
Name: Adarsh N S	Reg No: 24204004
Program Title : Swap two variables using a temporary variable.	

Program :

```
 a=input("enter 1st number:")
b=input("enter 1st number:")
t=a
a=b
b=t
print(f"a is {a} b is {b}")
```

Output Screenshot/Text

```
enter 1st number:1
enter 1st number:2
a is 2 b is 1
```

Department of Computer Science
DATA ANALYTICS USING PYTHON RECORD

Program No: 2	Date: 09/07/2025
Name: Adarsh N S	Reg No: 24204004

Program Title : Takes a user input string and returns the number of vowels in it

Program :

```
 str=input("enter string : ")
c=0
for i in range(len(str)):
  if str[i] == 'a' or str[i] == 'e' or str[i] == 'i' or str[i] == 'o' or str[i] == 'u':
    c=c+1
print(f"count of vowels is {c}")
```

Output Screenshot/Text

```
enter stringaeiouqwe
count of vowels is 6
```

Department of Computer Science
DATA ANALYTICS USING PYTHON RECORD

Program No: 3	Date: 09/07/2025
Name: Adarsh N S	Reg No: 24204004
Program : Title Write a program to reverse a string without using built-in functions.	

Program :

```python
def reverse_string(s):
    reversed_str = ''
    for i in range(len(s) - 1, -1, -1):
        reversed_str += s[i]
    return reversed_str

input_str = input("Enter a string: ")
result = reverse_string(input_str)
print("Reversed string:", result)
```

Output Screenshot/Text

```
Enter a string: hi
Reversed string: ih
```

Department of Computer Science
DATA ANALYTICS USING PYTHON RECORD

Program No: 4	Date: 09/07/2025
Name: Adarsh N S	Reg No: 24204004
Program Title : Concatenate two strings using variables and print the result.	

Program :

```
str1=input("enter string1")
str2=input("enter string2")
str3=str1+str2
print(str3)
```

Output Screenshot/Text

```
enter string1hi world
enter string2hi heell
hi worldhi heell
```

Program No: 5	Date: 09/07/2025
Name: Adarsh N S	Reg No: 24204004

Program Title : Write a program that checks whether a substring exists in a given string.

Program :

```python
def is_substring(main_str, sub_str):
    main_len = len(main_str)
    sub_len = len(sub_str)

    for i in range(main_len - sub_len + 1):
        match = True
        for j in range(sub_len):
            if main_str[i + j] != sub_str[j]:
                match = False
                break
        if match:
            return True
    return False

main_string = input("Enter the main string: ")
substring = input("Enter the substring to check: ")

if is_substring(main_string, substring):
    print("Substring exists in the main string.")
else:
    print("Substring does not exist in the main string.")
```

Output Screenshot/Text

```
Enter the main string: hello
Enter the substring to check: ll
Substring exists in the main string.
```

Program No: 24	Date: 10/09/2025
Name: Adarsh N S	Reg No: 24204004
Program Title : Write a program to handle division by zero exception.	

Program :

```python
# Program to handle division by zero exception

# Take user input
numerator = float(input("Enter numerator: "))
denominator = float(input("Enter denominator: "))

try:
    result = numerator / denominator
    print(f"Result: {result}")
except ZeroDivisionError:
    print("Error! Division by zero is not allowed.")
```

Output Screenshot/Text

```
Enter numerator: 23
Enter denominator: 0
Error! Division by zero is not allowed.
```

Program No: 25	Date: 10/09/2025
Name: Adarsh N S	Reg No: 24204004

Program Title : Create a custom exception class NegativeValueError and raise it when negative input is given.

Program : # Custom exception class
```python
class NegativeValueError(Exception):
    def __init__(self, value):
        super().__init__(f"Negative value not allowed: {value}")
        self.value = value

# Function to take input and check for negative value
def get_positive_number():
    num = float(input("Enter a positive number: "))
    if num < 0:
        raise NegativeValueError(num)
    return num

# Main program
try:
    number = get_positive_number()
    print(f"You entered: {number}")
except NegativeValueError as e:
    print("Error:", e)
except ValueError:
    print("Invalid input! Please enter a number.")
```

Output Screenshot/Text

```
Enter a positive number: -78
Error: Negative value not allowed: -78.0
```

Program Title : Demonstrate use of try-except-else-finally

Program :
```python
try:
    numerator = float(input("Enter numerator: "))
    denominator = float(input("Enter denominator: "))

    result = numerator / denominator

except ZeroDivisionError:
    print("Error! Division by zero is not allowed.")

except ValueError:
    print("Invalid input! Please enter numeric values.")

else:
    print(f"Result of division: {result}")

finally:
    print("Program execution completed.")
```

Output Screenshot/Text

```
Enter numerator: 20
Enter denominator: 0
Error! Division by zero is not allowed.
Program execution completed.
```

Program Title: A Comparative Study of Classification Algorithms on Real-World Data	

IMPORT AND EXPLORE THE DATASET

Loaded the crocodile dataset and examined its structure, types, and basic statistics.

```
import pandas as pd
df = pd.read_csv('/content/crocodile_dataset.csv')
display(df.head())
```

DATA CLEANING AND PREPROCESSING

Fixed data types, handled outliers, and standardized categorical values.

Inspect data – Checking for data types and missing values

```
display(df.info())
display(df.isnull().sum())
display(df.describe())
```

To display unique values and their counts based on various factors

```
for col in ['Common Name', 'Scientific Name', 'Family', 'Genus', 'Age Class', 'Sex',
'Country/Region', 'Habitat Type', 'Conservation Status']:
    print(f"Value counts for {col}:")
    display(df[col].value_counts())
```

Identify and address any extreme values that could skew analysis.

```
display(df[['Observed Length (m)', 'Observed Weight (kg)']].describe())

import matplotlib.pyplot as plt
import seaborn as sns

fig, axes = plt.subplots(1, 2, figsize=(16, 6))
```

```
sns.boxplot(ax=axes[0], y=df['Observed Length (m)'])
axes[0].set_title('Box Plot of Observed Length (m)')
axes[0].set_ylabel('Observed Length (m)')

sns.boxplot(ax=axes[1], y=df['Observed Weight (kg)'])
axes[1].set_title('Box Plot of Observed Weight (kg)')
axes[1].set_ylabel('Observed Weight (kg)')

plt.tight_layout()
plt.show()

fig, axes = plt.subplots(1, 2, figsize=(16, 6))

sns.histplot(ax=axes[0], data=df, x='Observed Length (m)', kde=True)
axes[0].set_title('Histogram of Observed Length (m)')
axes[0].set_xlabel('Observed Length (m)')
axes[0].set_ylabel('Frequency')

sns.histplot(ax=axes[1], data=df, x='Observed Weight (kg)', kde=True)
axes[1].set_title('Histogram of Observed Weight (kg)')
axes[1].set_xlabel('Observed Weight (kg)')
axes[1].set_ylabel('Frequency')

plt.tight_layout()plt.show()
```

Plotted distributions and relationships to understand trends in length, weight, and age class.

```
import matplotlib.pyplot as plt
import seaborn as sns

# Distribution of Observed Length (m)
plt.figure(figsize=(10, 6))
sns.histplot(data=df, x='Observed Length (m)', kde=True)
plt.title('Distribution of Observed Length (m)')
plt.xlabel('Observed Length (m)')
plt.ylabel('Frequency')
plt.show()

# Distribution of Observed Weight (kg)
plt.figure(figsize=(10, 6))

sns.histplot(data=df, x='Observed Weight (kg)', kde=True)
plt.title('Distribution of Observed Weight (kg)')
plt.xlabel('Observed Weight (kg)')
plt.ylabel('Frequency')
plt.show()

# Relationship between Observed Length and Observed Weight
plt.figure(figsize=(10, 6))
sns.scatterplot(data=df, x='Observed Length (m)', y='Observed Weight (kg)', hue='Age
Class')
plt.title('Observed Length vs Observed Weight')
```

```
plt.xlabel('Observed Length (m)')
plt.ylabel('Observed Weight (kg)')
plt.show()

# Box plot of Observed Length by Age Class
plt.figure(figsize=(12, 6))
sns.boxplot(data=df, x='Age Class', y='Observed Length (m)')
plt.title('Observed Length by Age Class')
plt.xlabel('Age Class')
plt.ylabel('Observed Length (m)')
plt.show()

# Box plot of Observed Weight by Age Class
plt.figure(figsize=(12, 6))
sns.boxplot(data=df, x='Age Class', y='Observed Weight (kg)')
plt.title('Observed Weight by Age Class')
plt.xlabel('Age Class')
